

CCC® Valuation – Packages Reference Guide

Package: Additional equipment originally installed on the vehicle that may add additional value beyond the current option list.

Package Notes:

If all corresponding components of a package are installed on a vehicle, that doesn't necessarily mean that the package itself is installed on the vehicle. After factory equipment is excluded from packages.

Build Sheet Considerations:

If your company is contracted for Build Sheets, a valid vehicle VIN is decoded, and Build Sheet data is available for the selected vehicle:

Installed packages will be pre-selected within the workfile and/or valuation request.

The components of the installed packages will be denoted as installed within the workfile and/or valuation request.

Installed packages will display “**inst**” on the VER.

Packages can be identified by:

- Badging
- Window Stickers
- Equipment
- Build Sheet
- Vehicle Equipment Report (VER)

Recommended Fields to Populate for Package Selection:

- Vehicle VIN
- Vehicle Year, Make & Model

If options or equipment are listed with the word “**package**” or “**pkg**” on the VER, that doesn't necessarily mean they denote packages.

If your company is NOT contracted for Build Sheets, or if Build Sheet data is unavailable for the selected vehicle:

If one or more packages are manually selected within the Options tab of the Valuation Request within the CCC® Portal, the associated components will display “**pkg**” within the request.
